- Contact us about our Premium Support options..

OEM Internet Web Content / URL Filtering

BluePrint Data categorizes web sites into content categories in 63 languages. This category information is available to our OEM partners via direct licensing of our database, or with various technologies to implement low-impact, scalable, and cost effective solutions including cloud and virtual systems. Our licenses include all software and database updates as well as 24/7 support.

The BluePrint Data Cloud Engine provides URL / Web site lookups for content filtering via the Amazon Elastic Computer Cloud (Amazon EC2) platform, which offers very high efficiency, extremely low latency, excellent reliability, on-demand scalability, international regions and availability zones, edge network services, and 99.95% uptime guarantee

At BluePrint Data, our goal is to enable our OEM partners to offer superior content and web filtering products and services at a remarkable value. We offer flexible licensing terms, a dedicated OEM support team, and a personal touch for an exact fit with hands on implementation when needed. We provide support and technical assistance throughout the life of the partnership.

BluePrint Data provides a set of API's, SDK's, and Web based tools to utilize our in-the-cloud Internet Filtering service. If a cloud installation is not what you need, we also provide copies of the database and/or content engine for your local use, installation on network or client devices, or for your data center / network.

BluePrint Data has the world's largest 100% human reviewed URL Filter Database

The API's, SDK's, and web based tools provide you JSON (Java), HTML, and XML options and versions to request the URL / web site lookups.

A URL lookup request can be a "strict match", a "like" query, or a "recursive" query. A single URL request may result in multiple replies because a "like" search for a request like google.com returns all results in the database that contain the string "[goolge.com](http://google.com)". A "recursive" search for a request like google.com/dir/subdir/ will return all pages under google.com/dir/subdir/, if none are found then it will try google.com/dir/ and so on until some results are found.
